Anton Perch

Senior Software Engineer

+48 571 404 348 | perch.anton@gmail.com | LinkedIn

SUMMARY

Senior Software Engineer with 9 years building production JavaScript/TypeScript applications across React, Next.js, Node.js, and NestJS. AI-native engineer with hands-on experience designing and shipping LLM-powered features (OpenAI, Anthropic) end-to-end, and integrating agentic development workflows (Claude Code, MCP, Claude Skills) into daily engineering practice. Proven track record of independently designing, shipping, and monetizing full products, from system architecture through to production and paid acquisition. Promoted to tech lead; experienced in owning architecture decisions, mentoring engineers, and driving features from concept to production.

SKILLS

Languages & Frameworks: JavaScript, TypeScript, React, Next.js, Node.js, NestJS, GraphQL, REST APIs, WebSockets
AI & Agentic Engineering: LLM Integration (OpenAI, Anthropic), Claude Code, Codex, MCP, Claude Skills, CLAUDE.md/AGENTS.md configuration
Data & Infra: PostgreSQL, SQL, MongoDB, Firestore, Supabase, Docker, CI/CD, GitHub Actions, Vercel
Security: OAuth, OIDC, Session-based Authentication
Architecture & Practices: Microservices, System Design, Frontend Architecture, Performance Optimization, State Management (Redux, Zustand), Automated Testing (Jest, Vitest)
Also worked with: Symfony, Twig, Electron, Stripe, Storybook, Tailwind CSS, MUI

PROFESSIONAL EXPERIENCE

Senior Frontend Developer *(Oct 2024 - Present)* **ITSharkz**, Warsaw (Remote)

- Design and build complex frontend modules for Swizy (B2B events/discounts platform) using Next.js, React, and GraphQL, working within a large modular monolith of interdependent subsystems.
- Design and engineer interactive UI features from scratch, including a Google Maps event explorer with dynamic GraphQL-driven data, custom styling, popups, hover states, and marker clustering for dense areas - translating Figma designs and UX flows into production-ready components.
- Built a custom MCP server to automate the team's development workflow end-to-end - from ticket creation to Jenkins test runs - orchestrating Git, Jira, Slack, and Confluence MCP integrations into a single pipeline.
- Integrate AI coding agents (Claude Code, Codex) into daily development, configuring MCP servers (GitHub, Jira, Figma, Storybook), custom Claude Skills, and CLAUDE.md/AGENTS.md project instructions to accelerate delivery and enforce team conventions.
- Develop and maintain SSR web components for Qobuz.com (hi-res music streaming) across all regional domains, using Symfony (Twig) and TypeScript (Stimulus), prototyped and integration-tested in Storybook before release.

- Implement accessible, mobile-first, responsive UI aligned with design-system, RGAA (French government accessibility), and WCAG 2.1 AA standards, with hands-on expertise across component-level accessibility patterns and breakpoints.
- Review PRs and mentor a colleague, contributing to architectural decisions on new feature integrations.
- Collaborate with backend teams on API design and data contracts for scalable integration.

Senior Software Engineer *(Sep 2021 - Aug 2024)* **Dashbouquet Development**, Warsaw (Remote)

- Delivered full-stack web and desktop applications using React, Next.js, Node.js, NestJS, PostgreSQL, and Electron across multiple product-driven client projects.
- Promoted to Tech Lead on an AI dating-assistant app: led a team of 2, drove the feature roadmap directly with the client, and owned technical decisions and code review.
- Led backend migration from serverless Firebase to a NestJS server, cutting LLM response times from 10-15s to ~3s and improving stability; architected the AI pipeline (image understanding via Anthropic Claude, message generation via OpenAI) with prompt versioning, structured outputs, and streaming responses.
- Designed AI-powered features across multiple projects using OpenAI and Anthropic models, including prompt engineering, model/prompt configuration and observability (Braintrust), and OCR research (Tesseract, vision models).
- Built real-time computer-vision advertising systems using WebSockets, integrating camera streams and human-detection neural networks into interactive Electron + React applications.
- Developed Web3 reward and airdrop modules with social integrations (Twitter/X, Discord, Telegram, Instagram), OAuth flows, and smart contract interaction.
- Took ownership of technology selection, infrastructure setup, and database design; mentored developers, participated in hiring, and rebuilt a team after turnover.

Middle Software Engineer *(Jul 2019 - Aug 2021)* **XB Software**, Minsk (Office)

- Developed a framework-agnostic JavaScript widget library (DHTMLX Suite) compatible with React, Angular, Vue, Svelte, and legacy environments, including a custom reactive rendering mechanism built on the JavaScript event loop and microtask queue.
- Built extensible component architecture using class-based patterns with controlled rendering cycles, performance optimization, and cross-browser support (including legacy IE8+) via Babel and polyfills.
- Covered components with unit and e2e tests (Jest, Mocha/Chai, Cypress); integrated widgets into diverse client environments with demo apps and usage documentation.
- Mentored 2 junior developers and contributed to internal knowledge sharing.

Junior Full Stack Engineer *(Aug 2017 - Jul 2019)* **Travel Agency**, Minsk (Office)

- Designed and built a full-stack CRM system from scratch for booking management and sales workflow automation, including role-based access control and real-time activity tracking (PHP, JavaScript, WebSockets).
- Worked directly with the business owner to gather requirements and align development with operational

needs.

PET PROJECTS

Stash Loot Stack | Web Application (Next.js + Supabase)

- Designed and developed a production-ready collectibles portfolio tracker using Next.js, React, TypeScript, and Supabase, deployed on Vercel.
- Built authenticated asset management across 8 TCGs (Pokemon, Magic, Yu-Gi-Oh and more), CS2 skins, LEGO, Funko, and Hot Wheels, with Steam integration for automatic CS2 inventory import.
- Implemented portfolio dashboards with total value, profit/loss, ROI, allocation views, activity history, and price history charts.
- Integrated automated market price synchronization via CSFloat API (CS2) and aggregated data feeds (TCG), refreshed through scheduled cron jobs.
- Shipped a Stripe-based paid tier unlocking higher item limits and configurable email price alerts (threshold and percentage rules) via Resend.
- Owned full product lifecycle: domain, paid Google Ads acquisition, and monitoring/analytics via Sentry and PostHog.

Relax Scramble | Desktop Steam Game (Electron + React)

- Owned the product end-to-end as an indie developer: competitor research, asset creation from scratch, store page positioning, and marketing/promotion to drive discovery and wishlists on Steam.
- Designed and shipped a cross-platform desktop game (~29K lines of TypeScript, 170+ components/modules) using Electron, React 19, Redux Toolkit, and Vite, from concept to Steam release, integrating the Steam SDK for cloud saves, achievements, and rich presence.
- Built a custom word-validation and board-generation engine: an 8-language dictionary system (nspell-based prefix tries covering EN/FR/DE/ES/RU/PL/CS/UK) paired with a pruned DFS search that guarantees every generated board is solvable, offloaded to a worker thread to keep the UI responsive.
- Implemented real-time 2-player online co-op on a shared split board (6x6, role-owned halves), architecting the Steam P2P networking layer directly on the Steamworks SDK (packet polling, session handling, reliable delivery) rather than a third-party multiplayer library.
- Designed a full progression system: account levels/XP, 13 Steam achievements, a tiered cosmetics economy (common to legendary), and per-partner co-op save slots, with receipt-based reward delivery to guarantee idempotent grants across crashes.
- Hardened Steam Cloud save/load against edge cases (e.g. preventing a temporarily unavailable Cloud from being mistaken for a new player and overwriting existing progress), and resolved a Steam Deck compatibility issue tied to platform flag detection.
- Covered the codebase with 450+ automated tests (Jest, Testing Library) across game logic, progression, and UI state.
- Iterated on gameplay and features based on player feedback and sales/wishlist data analysis, shipping four post-launch updates (co-op, customization shop, statistics, account levels) driven by the product roadmap.

- Managed the full release lifecycle: packaging (electron-builder + NSIS), SteamPipe depot/branch management, and store configuration; localized into 8 languages.

EDUCATION

Master of Engineering in IT & Ergonomics.
Belarusian State University of Informatics and Radioelectronics (2014 - 2020)

LANGUAGES

- Russian (native)
- English (C1)
